OVERVIEW

The Cessna 206 Stationair is an evolution of the Cessna 210, which has been utilized in private and commercial operations around the world. With rugged construction, a powerful engine, and large cabin capacity, the 206 is beloved by bush pilots for its durability and flexibility. It's a package aircraft that Cessna describes as the SUV of the sky. In fact, the Stationair moniker is the result of a combination of the words "Station Wagon of the air." During its 206 model production run, Cessna built over 8,500 airframes.

The six-seat Cessna 206 was introduced in 1964 and includes many variants. The U-models feature a pilot side front door, and an oversized co-pilot side aft "utility" door that allows for easier loading of passengers and cargo.

N6166U is a U206G variant, which features the oversized utility door, Continental IO-520-F engine, and a max gross weight of 3,600 lbs. It has modern avionics, Alaska Bushpilots STC wheels, and a history of international operations, including mission work in Haiti. Intensive airframe inspection and remediation has corrected any humidity-induced problems as a result of this mission work.
